

Markdown Feature Demo

Welcome to a comprehensive demonstration of **Markdown** features supported by PurplePlatypus.

1. Headings

H1 Heading

H2 Heading

H3 Heading

H4 Heading

H5 Heading

H6 Heading

2. Text Formatting

- **Bold text** using double asterisks
 - *Italic text* using single asterisks
 - ***Bold and italic*** combined
 - ~~Strikethrough text~~ using tildes
 - Underlined text using double plus
 - `Inline code` using backticks
 - Regular text with a line break
-

3. Lists

Unordered List

- First item
- Second item
 - Nested item
 - Another nested item
 - Deeply nested item
- Third item

Ordered List

1. First step
2. Second step
 1. Sub-step A

2. Sub-step B
3. Third step

Task List

- Write the introduction
- Add examples
- Review the document
- Publish it

4. Links and Images

Visit [PurplePlatypus on GitHub](#) for more info.

You can also use reference-style links like [this one](#) to headings.

You can also use reference-style links like [this one](#) to arbitrary named anchor using HTML.

<https://glowingcat.com> "Example Website"

5. Blockquotes

This is a blockquote.

It can span multiple lines and paragraphs.

Nested blockquotes are also supported.

— *Someone Famous*

6. Code Blocks

Inline: use `printf()` to output text.

Fenced code block with syntax highlighting

```
def greet(name):  
    """Say hello to someone."""  
    print(f"Hello, {name}!")
```

7. Tables

Feature	Supported	Notes
Headings	✓	Six levels (H1–H6)
Bold / Italic	✓	Standard markdown syntax
Tables	✓	GitHub Flavored Markdown
Math	✓	Inline and block
Task lists	✓	Interactive checkboxes

Aligned columns

Left Aligned	Center Aligned	Right Aligned
Apples	Red	1.50
Bananas	Yellow	0.75
Cherries	Dark	3.20

Cells can also contain **formatting**, code , and [links](#):

Feature	Syntax	Example
Bold	**text**	text

Italic	<i>*text*</i>	<i>text</i>
Code	<code>`code`</code>	<code>code</code>
Link	<code>[label](url)</code>	label

8. Images

Image Support

Image Style Attributes

9. Math Notation (LaTeX)

You can write inline math using single dollar signs, like $E = mc^2$ or the golden ratio $\varphi = \frac{1+\sqrt{5}}{2}$.

For larger expressions, use block math with double dollar signs:

$$\int_a^b f(x), dx = F(b) - F(a)$$

Common Examples

The quadratic formula:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Euler's identity:

$$e^{i\pi} + 1 = 0$$

A summation:

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}$$

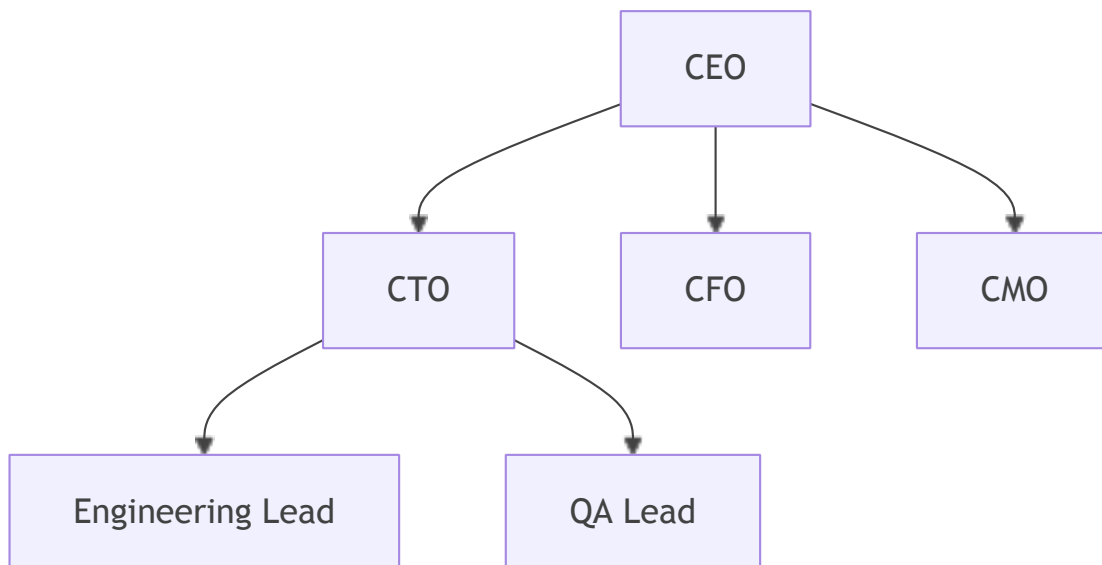

Greek letters and subscripts can be mixed inline too, such as $\alpha_1, \beta_2, \gamma_3$ or a limit $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$.

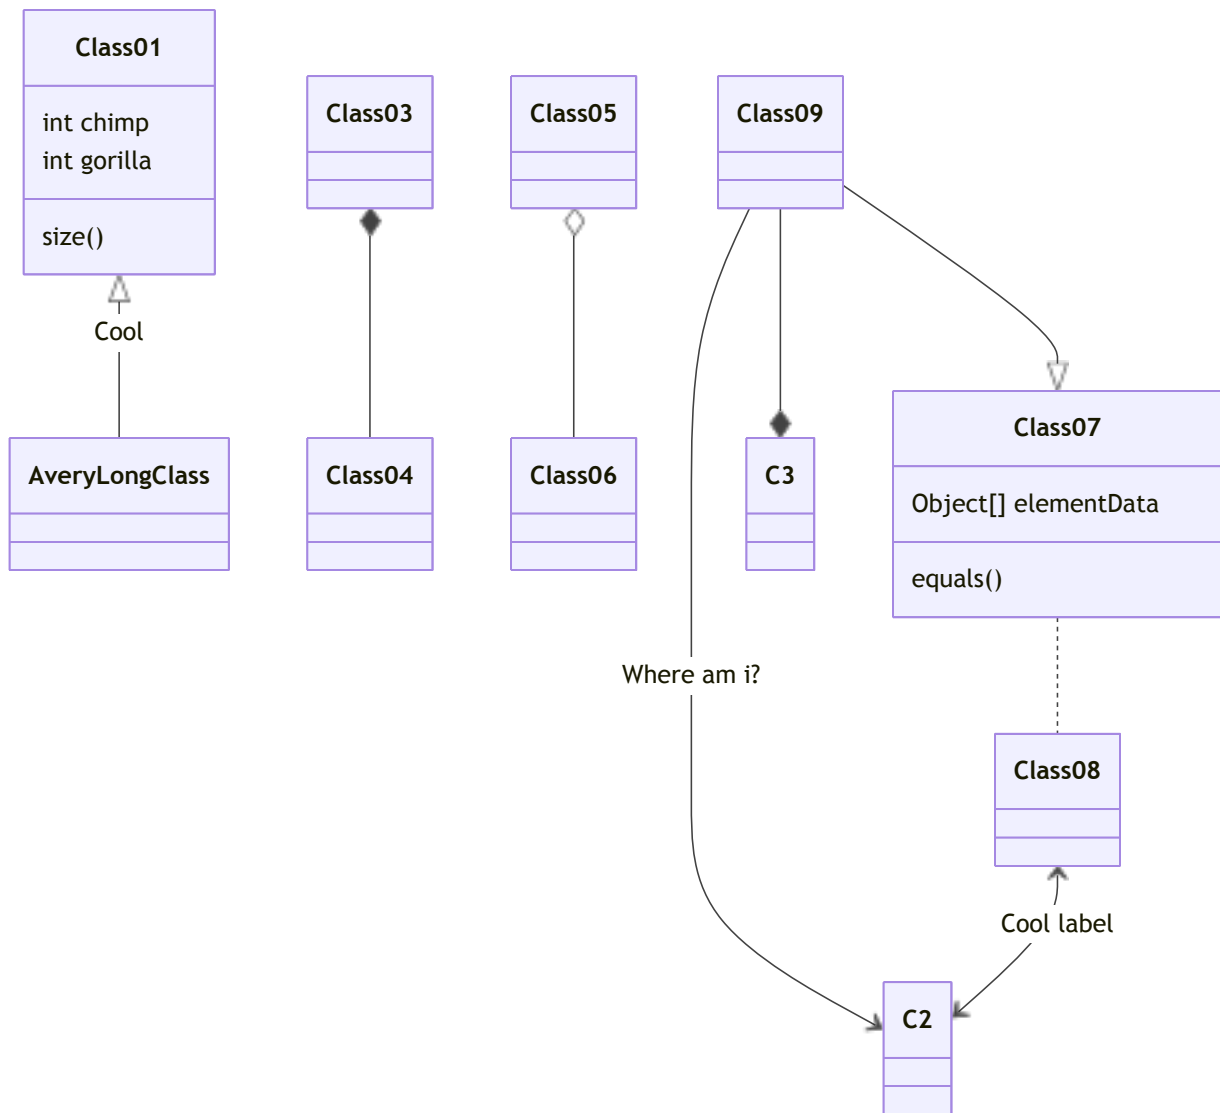

10. Footnotes

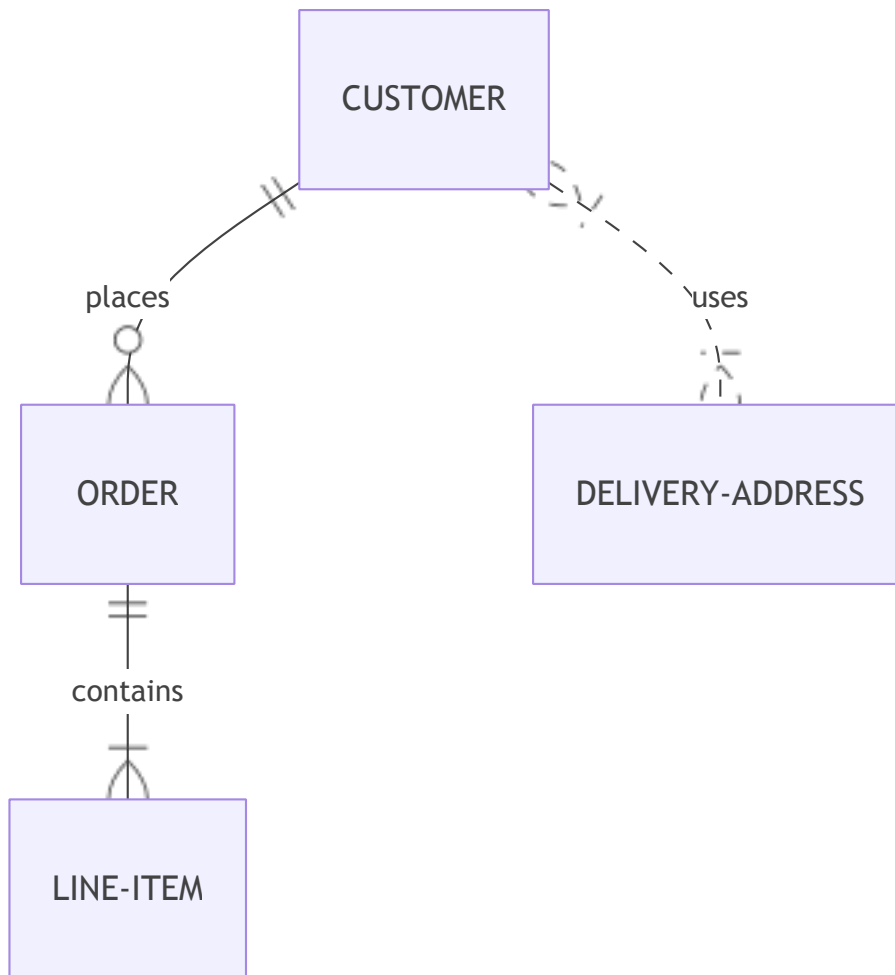

This is a line with a footnote¹

11. Mermaid Charts and Diagrams

Support for Mermaid Charts and Diagrams using a simple markdown format.

For more information, see the [Mermaid syntax documentation](#).

11. Horizontal Rules

Use three or more dashes, asterisks, or underscores:

12. Escaping Characters

Use a backslash to escape special characters: *, `, #.

13. HTML in Markdown

You can embed HTML tags directly, like _{subscript} and ^{superscript}

14. Export Formats

PurplePlatypus lets you export your document to several formats, so you can share your work wherever it needs to go.

Format	Extension	Best For
HTML	.html	Publishing to the web or viewing in a browser
PDF	.pdf	Printing and sharing polished documents
Markdown	.md	Keeping the raw source, portable and editable
RTF	.rtf	Rich Text Format
Plain Text	.txt	Plain Text Format (loses formatting)
TextBundle	.textbundle	Bundle of Markdown file and images

HTML

Exports a fully rendered web page with all formatting, tables, images, and math preserved. Ideal for embedding in websites or sharing a link.

PDF

Produces a print-ready document with consistent page layout.
Great for reports, documentation, and anything you plan to hand off or archive.

Markdown

Saves the plain-text source exactly as written. This keeps your document lightweight, version-control friendly, and editable in any text editor.

TextBundle

TextBundle is an open format that packages your Markdown text **and its referenced assets** — images, attachments, and other media — into a single bundle. Instead of scattering image files across folders and worrying about broken links, everything travels together as one self-contained unit.

This makes TextBundle ideal for moving documents between apps and devices without losing images along the way. A `.textbundle` is technically a folder (shown as a single file on macOS) containing the Markdown source alongside an `assets` directory, while the `.textpack` variant zips it all into one compressed file for easy sharing. Because the format is open and widely supported by Markdown editors, your content stays portable and future-proof.

RTF

Rich Text Format (RTF) exports your document as styled text that opens cleanly in word processors like Microsoft Word, LibreOffice, and Apple Pages — and pastes nicely into emails and other rich-text fields.

Note: RTF is a simpler format than HTML or PDF, so **not all Markdown features are supported**. Core styling like headings, bold, italic, lists, and basic tables carries over well, but advanced elements — such as math notation, task-list checkboxes, footnotes, and syntax-highlighted code blocks — may be simplified or dropped during export. For documents that rely on those features, HTML or PDF will preserve them more faithfully.

1. Here is the footnote. [↩](#)
